                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel oligonucleotides comprising several nucleotide units which are specifically hybridisable with a selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guanidinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US2003092046-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligomers containing guanidinium groups, useful for modulating expression by hybridizing oligomer with single- or double-stranded

The guanidinium functionalised nucleotide compounds are used for preparation of oligomers useful for diagnostic, therapeutic and investigative applications. The 2-0-guanidinium ethyl modification increases binding affinity to a target. The present sequence represents guanidinium functionalised oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New guanidinium functionalized oligomers used for diagnostic,

The invention relates to a guanidinium functionalised nucleotide compounds. The guanidinium functionalised nucleotide compounds are understand to the compounds of the graphication of oligomers useful for diagnostic, therapeutic and investigative applications. The 2-O-guanidinium ethyl modification increases binding affinity to a target. The present sequence represeguantidinium functionalised oligonucleotide.

                                                                                                                      The invention relates to a novel diagnostic polynucleotide composition.

The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1 (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a sequence comprising one or more of the nucleotide exchanges (SNP's) given the specification and at least 8 bases of surrounding sequence of the CHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide is useful for the molecular variant of the MCHR1 gene. This polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the celetion indicates a predisposition to breast and overian cancer. The present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polymucleotide is a mutant human BRCA1 genomic DNA fragment that arises as a result of a crecombination event (deletion 4), which causes the omission of exons 16 crecombination in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                    of a subject an effective amount of an inhibitor. The uligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(les), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiration, bronchitis, airway (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
                                                                                                                                                                                                                                                                                                                                                                                 initiation codon, coding region with 2-10 nucleotides or 5 end and 5 end of nucleic acid target comprising gene(s) chosen from e.g. end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II) 4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways respiratory or lung disease, which involves administering to the airways and the salts of the salts of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The present invention relates to an oligonucleotide anti-sense to e.g., cc initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-cc end of nucleic acid target comprising gene(s) chosen from e.g. cc interleukin (II)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a cc respiratory or lung disease, which involves administering to the airways cf a subject an effective amount of an inhibitor. The oligonucleotide is cc useful for production of a medicament for the prevention and/or treatment cf a respiratory or lung disease. The respiratory or lung disease is cc chosen from airway inflammation, allergy(ies), asthma, impeded cc respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CODD), allergic rhinitis (RR), acute respiratory distress syndrome (RRDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the

interleukin (II)-4 receptor, II-5 receptor or salts of the
oligonucleotide and optionally surfactant operatively linked to the
oligonucleotide. The method is useful for preventing or treating a
respiratory or lung disease, which involves administering to the airways
of a subject an effective amount of an inhibitor. The oligonucleotide is
useful for production of a medicament for the prevention and/or treatment
of a respiratory or lung disease. The respiratory or lung disease is
chosen from airway inflammation, allergy(ies), asthma, impeded
respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
(CODD), allergic rhinitis (AR), acute respiratory distress syndrome
(ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
obstruction. The present sequence represents a receptor of the invention.
                                                                                                                                                                          interleukin; IL-4 receptor; IL-5 receptor; lung disease; airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       05-FEB-2004.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II)-4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy (its), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway (ARDS)
                                                                                                                                                                                    07-AUG-1998;

                                       The invention relates to 2'-O-aminoethylthioethyl-modified ribosyl nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful in diagnosis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistance towards nucleases. This sequence represents a modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistance towards nucleases. This sequence represents a modified antisense oligonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful ir diagnosis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and
                                                                                                                                                                                                                    New 2'-0-aminoethylthioethyl-modified ribosyl nucleosides useful as monomer for the synthesis of modified anti-sense oligonucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                   nanotubes; (2) physically modifying (M2) a nanotube; (3) linking (M3) nanotubes; (4) a several linked nanotubes (II) produced by (M3); (5) nanotubes; (4) a several linked nanotubes (II) produced by (M3); (5) nanotubes; (4) a several linked nanotubes (II) produced by (M3); (5) nanotubes; (4) nanotubes to specific targets; (6) a nucleic acid sensor (III) comprising (I), where the base sequence of the attached nucleic acid molecule is substantially complementary to all or a portion of the base sequence of the nucleic acid molecules being detected; (7) a DNA array consisting of an array of groups of one or more nanotubes, each group having one or more nucleic acid molecules of the same base sequence attached to each nanotubes in the group, and where the base sequence of the nucleic acid molecules, attached to the nanotubes in one group differs from those in other groups so that a number of different target DNA molecules may be detected; (8) an actuator comprising (I) and a membrane support to which the DNA-modified nanotubes are attached; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nanotube; nucleic acid sensor; DNA array; conductor; nanoparticle; biosensor; detection; screening; bacterial; viral; pharmaceutical; agricultural; food control; hygiene; environmental; forensic; nano-scale conductor; semiconductor; nano-electronic; prostatic ne
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Carbon nanotube attached with one or more nucleic acid molecules, as biosensor for screening presence of bacterial or viral nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-JUN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADM42087 standard; DNA; 19 BP
useful in clinical application for screening presence of bacterial overland nucleic acid, in pharmaceutical applications, agricultural applications, food control, hygiene and environmental monitoring and forensic applications. (II) is useful as a nano-scale conductor or semiconductor, more specifically as a component in nano-electronic applications, as a replacement for damaged nerves in prostatic
                                                                                                                          (9) a conductor (IV) comprising (I). (I) is useful in coating one or manotubes with manoparticles, which involves exposing (I) to nanoparticles comprising several attached complementary nucleic acid molecules, where the nanoparticles hybridise to the nucleic acid molecules on the surface of the nanotube(s) as well as self-annealing other nanoparticles, forming one or more coated nanotubes. (I) can be used as a biosensor for detecting complementary nucleic acid strands,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a nanotube (I) attached with one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-AUG-2002; 2002AU-00951274.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-AUG-2003; 2003WO-AU001118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-MAR-2004

                   The invention relates to nucleoside compounds. The nucleoside compounds are useful as antisense compounds in diagnostics, therapeutics, prophylaxis, and as research reagents and kits, and to prevent or delay infection, inflammation or tumour formation. The compounds have enhanced binding affinity properties. The present sequence represents a 2'-O-MOE-thio modified oligonucleotide.

                                                                                                                                                                                                                                                                                                                                         Enhancing renal uptake of an oligomeric compound in the diagnostic and therapeutic applications involves incorporating at least one modified ribosyl nucleoside into the oligomeric compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide #4 used in animal studies
                                                                                                                                                                                     Sequence 19
                                                                                                                                                                                                          reagents; and for treating infection caused by organisms (e.g. bacter yeast, protozoa and algae) in plants and higher animals. The present sequence is an oligonucleocide used in animal studies. This sequence used to illustrate the method of the invention.
                                                                                                                                                                                                                                                        The invention relates to 2'-O-modified ribosyl nucleosides and methods enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AD058963

                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to 2'-O-modified ribosyl nucleosides and methods of enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research reagents; and for treating infection caused by organisms (e.g. bacteria, yeast, protozoa and algae) in plants and higher animals. The present sequence is an oligomucleotide used to illustrate enzymatic degradation of 2'-O-modified oligomers. This sequence is used to illustrate the

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region cowith 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) 4 receptor, interleukin (IL) 5' receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, tryptase a, CC useful for preventing or treating a respiratory or lung disease. The CC useful for preventing or treating a respiratory or lung disease a receptor(s), and/or sthma and/or lung allergies associated with hyper-responsiveness to inflammation or an inflammatory disease. The respiratory or lung disease (CP), chronic obstructive pulmonary disease (COPD), callergic rhinitis, acute respiratory distress syndrome, pulmonary conchecens triction. This sequence represents an oligonucleotide of the pronchoconstriction. This sequence represents an oligonucleotide of the

           The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-f reducing or interleukin-f receptor, CC CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are cuseful for preventing or treating a respiratory or lung disease. The complete composition A CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with cc inflammation or an inflammatory disease. The respiratory or lung disease in flammation, allergy, asthma, impeded respiration, cc stick fibrosis (CP), chronic obstructive pulmonary of light or language of allergy and constructive pulmonary or language of allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-CCR1; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; acute respiratory distress syndrome; pulmonary hypertension;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identifying a subject at risk of breast cancer by or absence of one or more nucleotide polymorphic or diagnosing, preventing and/or treating breast cancer by
The invention relates to an isolated nucleic acid molecule (1), comprising a nucleic acid sequence chosen from 75 Nicotiana-derived conforme P450 enzyme fragment sequences. (I) is useful for producing a transgenic tobacco plant, which involves operably linking (I) with a promoter functional in the plant to create a plant transformation vector, and transforming the plant with the plant transformation vector,
                                                                                                                                                                       WPI;

The nucleic acid molecule is in an antisense orientation, sense orientation or is in a RNA interference orientation. The present sequence represents a PCR primer used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
                                                                                                                                   Sequence 60
                                                                                                                                                                                 comprises identifying non-protein-encoding nucleotide sequences within an mRNA transcript or a DNA sequence encoding same in the nucleome. The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide sequence enquiry #60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence

The present invention controlled that for determining the presence of a SNP, using the property of the invention. The PCR primers are used to amplify a conjugonucleotides of the invention. The PCR primers are used to amplify a conjugonucleotides are useful for genotyping a nucleic acid sample by conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides are useful for determining the presence, absence or conjugonucleotides and pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. conjugonucleotides and pathological phenotypic traits include diseases e.g. conjugonucleotides and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial conjugates and including, rheumatoid arthritis, multiple scherosis, recording the site of a single nucleotide polymorphism of human conferming and paternity analysis. The present sequence represents a fragment of human conferming the site of a single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

New isolated nucleic acid segments from the human determining polymorphic forms for use in e.g. for testing or phenotypic typing for disease. man genome forensics, paternity used for

Claim 16; Page 220; 310pp; English.

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary hypercytosis, yon Willebrand's disease, tuberous solerosis, hereditary spherocytosis, yon Willebrand's disease, tuberous solerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases

                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17655 to AAA18355 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19234 represent ribozyme sequences for Tie-2, and AAA19086 to AAA19086 co AAA19232 represent their corresponding target sequences; CC AAA19232 to AAA20361 and AAA21501 to AAA2155 represent ribozyme sequences; CC AAA19232 to AAA22168 represent their corresponding target sequences; CC AAA19232 to AAA22168 represent their corresponding target sequences; CC AAA21689 to AAA22168 represent their corresponding target sequences; CC AAA21689 to AAA22163 and AAA23363 to AAA23132 represent ribozymes of the invention are used for modulating target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are CC especially used to treat cancer, diabetic retinopathy, age related corresponding target sequences; related corresponding target sequences; and other syndrome, of theserous solerowise, pot-wine stains, Sturge Weber correspondences and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                     Query Match

```
CC hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 cross and analysis are an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16755 to AAA17161 to AAA1762 represent ribozyme sequences for ARNY, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 cand AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA19223 to AAA2361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC Sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC AAA21698 to AAA22475 and AAA23233 to AAA23342 represent ribozyme sequences; CC AAA21689 to AAA22475 and AAA23233 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to AAA23422 represent their corresponding target sequences corresponding target sequences. The ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to AAA23422 represent their corresponding target sequence of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, corresponding target sequences. The ribozyme sequence captured to treat cancer, diabetic retinopathy, age related corresponding target sequences. They are sequences of the invention (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, cand other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit beta-3 crimerial syndrome, of the syndrome, of the syndrome, cand arthritis, as well as necessarial subunit beta-3 crimerial syndrome, cand arthritis, as well as necessarial syndrome, stains, Sturge Weber captured to the levels of ARNT, Tie-2, integrin subunit beta-3

Integrin subunit beta 3 substrate sequence

SEQ ID NO: 6055

```
Crieaving activity, which specifically cleave RNA encoded by an aryl collegation nuclear transporter (ARNT) gene, an integrin subunit beta 3 cg gene, an integrin alpha 6 subunit gene, or a Tie-2 gene AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, cand AAA17168 to AAA17563 and AAA17622 represent tribozyme sequences for ARNT, cand AAA19154 represent ribozyme sequences; AAA17685 to AAA19855 and AAA19087 to corresponding target sequences; AAA17685 to AAA19855 and AAA19087 to cand AAA19155 to AAA19222 represent their corresponding target sequences; and aAA19155 and AAA19086 to AAA19123 to AAA123361 and AAA12350 to AAA12335 and AAA19086 cand AAA19123 to AAA21501 and AAA21501 to AAA21555 represent ribozyme sequences; aAA19223 to AAA21561 and AAA21501 to AAA21555 represent ribozyme cand cand active to AAA21561 and AAA21561 to AAA21342 represent ribozyme sequences; aAA12156 to AAA2168 represent their corresponding target sequences; cand aAA21591 to AAA21591 to AAA21592 represent ribozyme sequence for integrin subunit beta 3, and AAA2342 represent ribozyme of the invention are used for modulating target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or capture in subunit beta-3, integrin subunit alpha-6, or Tie-2. They are sequenced and other syndrome, (ARMD), inflammation, and arthritis, as well as meovascular degeneration (ARMD), inflammation, and arthritis, as well as an election of the syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARMT, Tie-2, integrin subunit beta-3.

RESULT 1830
AAA22832
CC cleaving activity, which specifically cleave RNA encoded by an aryl cleave RNA encoded by an aryl cleave RNA encoded by an aryl college and integrin alpha 6 subunit gene, an integrin subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 cc AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 cc AAA19123 to AAA20361 and AAA21501 to AAA21835 represent ribozyme sequences; CC AAA191250 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21683 represent their corresponding target sequences; CC AAA21689 to AAA21683 represent their AAA2342 represent ribozyme sequence cfor integrin subunit beta 3, and AAA22476 to AAA21500 and CC stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta 3, integrin subunit talpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related cespecially subunit beta-3, integrin subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted as a subunit alpha-6, or Tie-2. They are consisted to the subunit alpha-6, or integrin subunit alpha-6, or Tie-2. They are consisted to the consisted to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, contends the cou
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipooriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; 8s. Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; 8s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAA22832;

       CC The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17563 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18985 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18986 to AAA19086 CC CAAA19155 to AAA19222 represent their corresponding target sequences; CC CAAA19223 to AAA20361 and AAA21501 to AAA21562 to AAA21500 and CC CAA21596 to AAA21688 represent their corresponding target sequences; CC CAA21689 to AAA21688 represent their corresponding target sequences; CC CAA21690 to AAA22475 and AAA23263 to AAA23343 to CC CAA23422 represent their corresponding target sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to CC CAA23422 represent their corresponding target sequences. The ribozymes of CC CAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or carefullity of an modulating the synthesis, expression and/or carefullity of an modulating the synthesis, expression and/or carefullity of an modulating the synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Waber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin syndrome tables and diseases related to the levels of ARNT, Tie-2, integrin

                The present invention describes enzymatic nucleic acid molecules with cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for AF and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAA22739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding anglogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17560 and AAA17633 to AAA17684 represent their corresponding target sequences; AAA17623 to AAA18385 and AAA19187 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19087 to AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA19150 to AAA21595 represent ribozyme sequences; AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences; AAA19223 to AAA20361 and AAA21501 to AAA21596 to AAA21500 and AAA21596 to AAA21688 represent their corresponding target sequences; AAA21596 to AAA22475 and AAA2363 to AAA23472 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23343 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23343 represent ribozyme sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiniflammacory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;

The ribozymes the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc hydrocarbon nuclear transporter (ARNT) gene, an integrin submit beta 3 compared and integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17563 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA17623 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences; AAA17625 to AAA19386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19232 to AAA2361 and AAA21595 represent ribozyme corresponding target sequences; AAA19223 to AAA2361 and AAA21595 represent ribozyme sequences; AAA19223 to AAA2361 and AAA21595 represent ribozyme sequences; ChaA21689 to AAA2363 and AAA21691 to AAA2362 to AAA21680 and AAA2363 to AAA23342 represent their corresponding target sequences; ChaA21689 to AAA22475 and AAA23342 and AAA23342 represent ribozyme sequence; Che integrin subunit beta 3, and AAA22476 to AAA23342 represent ribozymes of the invention are used for modulating the synthesis, expression and/or crace integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related concervascular glaucoma, myopic degeneration, and arthritis, as well as negotionem, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, cand other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17567 and AAA17561 to AAA17622 represent ribozyme sequences for ANT, and AAA17168 to AAA17563 to AAA17623 represent ribozyme sequences for ANT, and AAA17168 to AAA17563 to AAA17634 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19233 to AAA21361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21596 to AAA21688 represent their corresponding target sequences; AAA21596 to AAA21689 to AAA2375 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to
                                                                    AA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes enzymatic nucleic acid molecules with RI cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARRY) gene, an integrin subunit beta 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 54; Page 240; 305pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27-MAR-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (RIBO-) RIBOZYME PHARM INC

CC hydrocarbon nuclear transporter (ARNI) gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA17675 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17661 to AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 to AAA191222 represent their corresponding target sequences; CC AAA19233 to AAA191222 represent their corresponding target sequences; CC AAA19233 to AAA21688 represent their corresponding target sequences; CC AAA21696 to AAA21688 represent their corresponding target sequences; CC AAA21696 to AAA21688 represent their corresponding target sequences; CC AAA21699 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to CC AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or ce specially used to treat cancer, diabetic retinopathy, age related comeouslating sequences and concer, diabetic retinopathy, age related comeouslating sequences, Sturge Weber concers of the process and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or Tie-2 and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and diseases related to the levels of ARNT, Tie-2, integrin subunit sequences and sequences

                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17561 to AAA17562 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17622 represent ribozyme sequences for ARNT, CC corresponding target sequences; AAA17685 to AAA1385 and AAA19087 to CC CAAA19154 represent ribozyme sequences for Tie-2, and AAA19386 to AAA19155 to AAA19222 represent their corresponding target sequences; AAA19232 to AAA19235 to AAA19355 and AAA19086 CC AAA19323 to AAA21501 to AAA21505 represent ribozyme sequences; AAA19223 to AAA2163 and AAA21501 to AAA21555 represent ribozyme sequences; AAA19223 to AAA22361 and AAA21501 to AAA2155 represent ribozyme sequences; AAA12823 represent ribozyme sequences; AAA12892 to AAA22363 and AAA21501 to AAA22362 represent ribozyme sequences; AAA12892 to AAA21688 represent their corresponding target sequences; AAA19323 to AAA21689 to AAA22363 and AAA2365 to AAA23432 represent ribozyme sequence for integrin subunit beta 3, and AAA2346 to AAA2342 represent ribozymes of the invention are used for modulating target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, cc especially used to treat cancer, diabetic retinopathy, age related corresponding target sequences; related corresponding and other syndrome, weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit beta-3 critegrin subunit beta-3 criteg
                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro (di)thioate link, having endonuclease activity. (A), and more generally any catalytic pucleic acid (A) that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

Recause of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of the same way that restriction endomucleases are used with DNA). The combination of therapeutic targets, and as research resistance to nucleases, binding affinity and/or activity. AAA2393 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences. AAA24748 to AAA26105 represent their corresponding target sequences. AAA24748 to AAA26105 represent their corresponding target sequences. AAA2593 to AAA26105 represent their corresponding target sequences. AAA2593 to AAA26105 represent their corresponding target sequences. AAA26219 to AAA26211 represent their corresponding target sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                    Query Match

Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:2051.

```
The present invention describes nucleic acids (A) that interact stably contain at least one phosphoro (di) thioate contain at least one phosphoro (di) thioate concerning that modulates expression of the oestrogen receptor concleic acid (A') that modulates expression of the oestrogen receptor conterconditions associated with levels of oestrogen receptor conditions associated with levels of oestrogen receptor conditions associated with levels of oestrogen receptor correlate inhibition of gene expression with alterations in phenotype, correlate (for RNA, in the same way that restriction endonucleases are consistence to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA25993 to AAA26107 to AAA26218 represent their corresponding target sequences. AAA2619 to AAA26271 represent oestrogen receptor hammer corresponding target antisense oligonucleotides used in the exemplification of the present corresponding target sequences. AAA26219 to AAA26271 represent oestrogen receptor hammer point of the present corresponding target sequences. AAA26219 to AAA26271 represent their corresponding target sequences and continents oligonucleotides used in the exemplification of the present corresponding target in the sequences and continents of the present corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                             밁

```
cc gene, are used to treat cancer (particularly of breast or endometrium).

Cc in vivo or by transforming cells ex vivo and implanting treated cells, or

Cc for other conditions associated with levels of oestrogen receptor.

Cc Because of the high selectivity for targeted RNA, (A) can also be used to

Cc correlate inhibition of gene expression with alterations in phenotype,

Cc particularly for identification of therapeutic targets, and as research

Cc reagents (for RNA, in the same way that restriction endomucleases are

Cc used with DNA). The combination of modifications in (A) improves

Cc vesistance to nucleases, binding affinity and/or activity. AAA23503 to

AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and

Cc AAA25993 to AAA25992 represent their corresponding target sequences,

Cc AAA25993 to AAA26107 to AAA26218 represent their corresponding target

Sequences. AAA36219 to AAA26271 represent their ribozyme sequences and

Cc sequences. AAA36219 to AAA26271 represent other ribozyme sequences and

Cc invention

Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA25992 represent their corresponding target sequences. AAA25993 to AAA26107 to AAA26218 represent coestrogen receptor hairpin ribozyme sequences and aAAA26107 to AAA26218 represent their corresponding target sequences. AAA2619 to AAA2619 to AAA26210 represent their corresponding target sequences and aAAA26107 to AAA26218 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens

Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and
                       Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement CC decides of the invention are useful as probes and primers for detecting, CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, convector or antibodies directed against the pulpeptides are useful for CC proparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            schizophrenia;

The invention relates to a novel isolated 17 mer nucleic acid sequence, component in the specification, a sequence containing at least 15 consecutive containing at least 15 consecutive containing at least 15 consecutive conditions at least 15 consecutive conditions at least 15 consecutive conditions at least 80 % identity to the 17 mer sequence with, after optimal conditions or the complement configuration of them under highly stringent conditions, or the complement configuration of the invention are useful as probes and primers for detecting conditions of the invention are useful as probes and primers for detecting conditions of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, colls containing the vector or antibodies directed against the polypeptides are useful for corpoparation of pharmaceuticals for prevention and/or treatment of viral containing the expression of the nucleic acids in schizophrenia. Analysis of the expression of the 17 mer nucleic acids in the containing the confirmation of the expression of the 17 mer nucleic acids in the containing the contain

samples

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

The invention relates to a novel isolated 17 mer nucleic acid sequence, compared in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement coff any of them, or the corresponding RNA. The novel isolated nucleic colds of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the nucleic acids, cells containing the corresponding vectors containing the nucleic acids, cells containing the corresponding to the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in gatient samples is useful for diagnosis and/or prognosis of these containing the useful for prognosis of these and seven prognosis of these and some containing the polypeptides can also be used to generate antibodies, and containing the useful as components of protein containing the useful for prognosis of these containing the useful for prognosis of the containing the useful for prognosis of the containing the useful for progn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; geantisense; sense; tumour; cell degeneration; cancer; Alzheimer's schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-SEP-2001; 2001FR-00011978.

CC Align
cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, cp polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell components. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour surrection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ន្តន្តន្តន្ត

                                                   unclectides from the 17 mer sequence, a sequence with, after optimal controlled from the 17 mer sequence, a sequence with, after optimal conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying and primers for detecting, cidentifying, quantifying and/or amplifying and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, collagonated production of containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cidentesses that are characterised by development of tumours or cell cidentesses that are characterised by development of tumours or cell cidentesses that are characterised by development of tumours or cell cidentesses and components of these contained to generate antibodies, and contained the polypeptide and antibodies are useful as components of procein the polypeptide and antibodies are useful as components of procein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             related human fukutin oligonucleotide of the invention
